The protein encoded by this gene is a member of the G-protein-coupled receptor family. This protein is a receptor for interleukin 8 (ILB). It binds to ILB with high affinity; and transduces the signal through a G-protein activated second messenger system. Knockout studies in mice suggested that this protein inhibits embryonic oligogeden dozy te precursor migration in developing spinal cord. This gene ILBRB; a peeu encoding another high affinity ILB expects as well as ILBRB; as pseudogene of ILBRB; from a gene cluster in a region mapped to chromosome 2q33-q36.
