The galectins are a family of beta-galectoside-binding proteins implicated in modulating cell-cell and cell-matrix interactions. The protein encoded by this done is an Stype ledfoil it is overcopressed in Hodglin's disease tissue and might participate in the interaction between the HandRS cells with their surrounding cells and might thus play a role in the pathogenesis of this disease and/or its associated immunodeficiency. Multiple alternatively spliced transcript variants have been found for this gene.
